Agenda

- What is Llama Stack
- Key topics (but not all)
 - Getting it running
 - Clients
 - Retrieval Augmented Generation
 - Tool Calling and Agents
 - Safeguards
 - Observability
- Q/A

What is Llama Stack

Client SDKs, CLI, User Interfaces

Telemetry

Service Providers

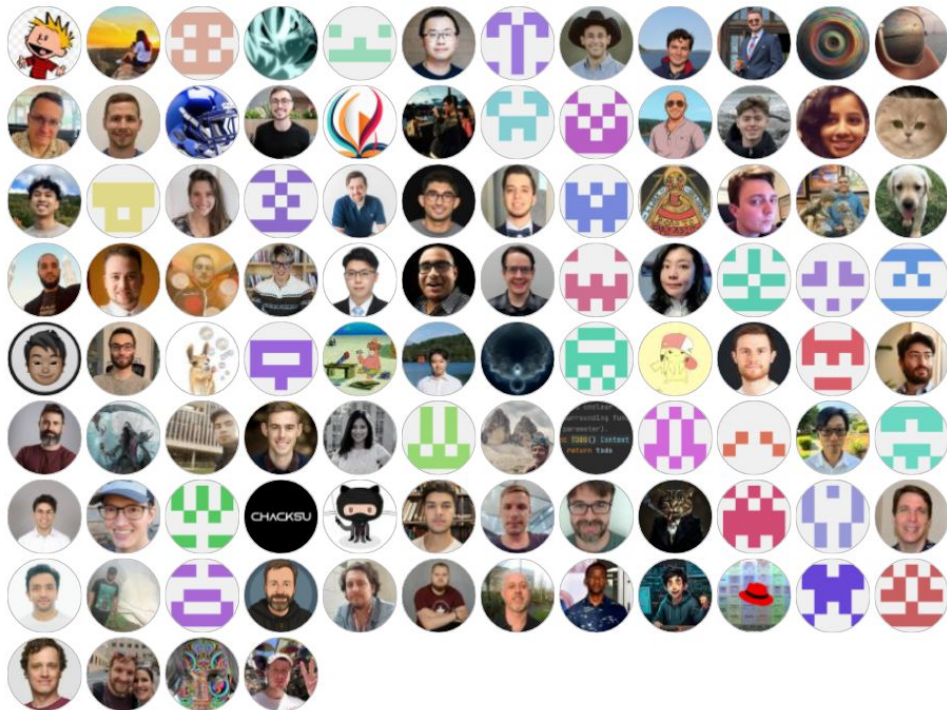

<https://github.com/llamastack/llama-stack?tab=readme-ov-file>

- Complete stack
- plug-in approach

Open Source

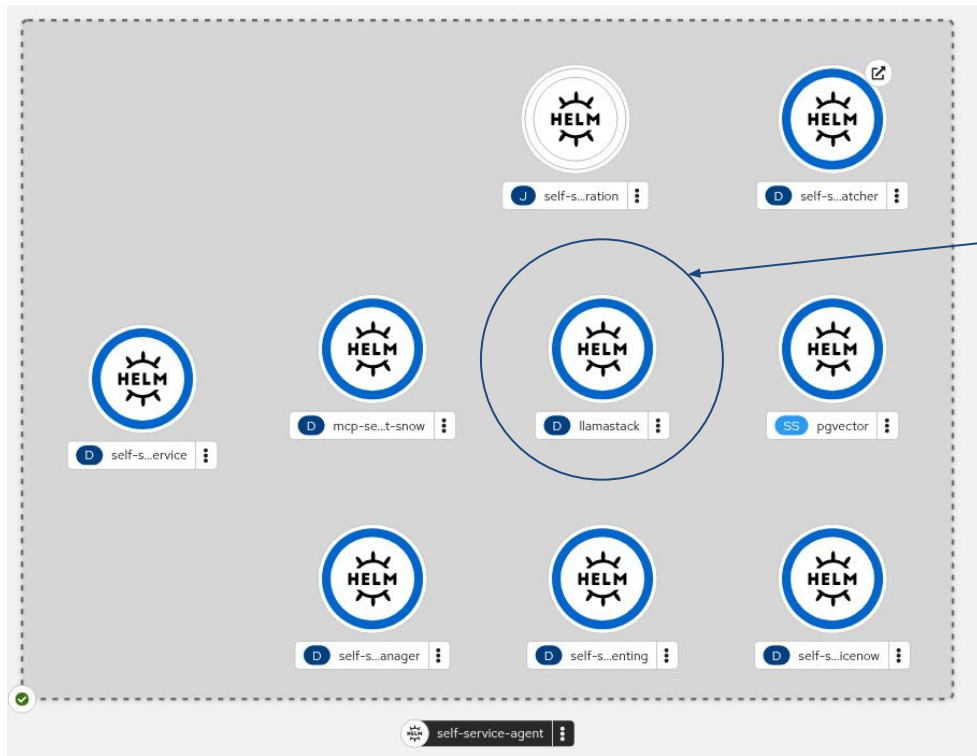

✨ Contributors

Thanks to all of our amazing contributors!

MIT License

Kubernetes friendly - Scales

Multiple replicas

rh-ai-quickstart/it-self-service-agent

Clients

- OpenAI compatible APIs
 - Present in Llama Stack but client implementation not always identical
 - Maybe due to versions
- Can use OpenAI clients instead
- May need both...

One difference I ran across

```
# Handle both dict (llama_client) and Pydantic object (openai_client)
if result.categories:
    if isinstance(result.categories, dict):
        categories_dict = result.categories
    else:
        categories_dict = result.categories.model_dump()
```

Ramping up with Python

How to implement observability with Python and Llama Stack

 Michael Dawson | September 12, 2025

Enhance your Python AI applications with distributed tracing. Discover how to use Jaeger and OpenTelemetry for insights into Llama Stack interactions.

Implement AI safeguards with Python and Llama Stack

 Michael Dawson | August 26, 2025

Learn how to implement Llama Stack's built-in guardrails with Python, helping to improve the safety and performance of your LLM applications.

Retrieval-augmented generation with Llama Stack and Python

 Michael Dawson | August 5, 2025

This tutorial shows you how to use the Llama Stack API to implement retrieval-augmented generation for an AI application built with Python.

Exploring Llama Stack with Python: Tool calling and agents

 Michael Dawson | July 15, 2025

Harness Llama Stack with Python for LLM development. Explore tool calling, agents, and Model Context Protocol (MCP) for versatile integrations.

Ramping up with JavaScript

How to implement observability with Node.js and Llama Stack

👤 Michael Dawson | June 12, 2025

Enhance your Node.js AI applications with distributed tracing. Discover how to use Jaeger and OpenTelemetry for insights into Llama Stack interactions.

Implement AI safeguards with Node.js and Llama Stack

👤 Michael Dawson | May 28, 2025

Explore how to utilize guardrails for safety mechanisms in large language models (LLMs) with Node.js and Llama Stack, focusing on LlamaGuard and PromptGuard.

Retrieval-augmented generation with Llama Stack and Node.js

👤 Michael Dawson | April 30, 2025

This tutorial shows you how to use the Llama Stack API to implement retrieval-augmented generation for an AI application built with Node.js.

A practical guide to Llama Stack for Node.js developers

👤 Michael Dawson | April 2, 2025

Explore how to run tools with Node.js using Llama Stack's completions API, agent API, and support for in-line tools, local MCP tools, and remote MCP tools.

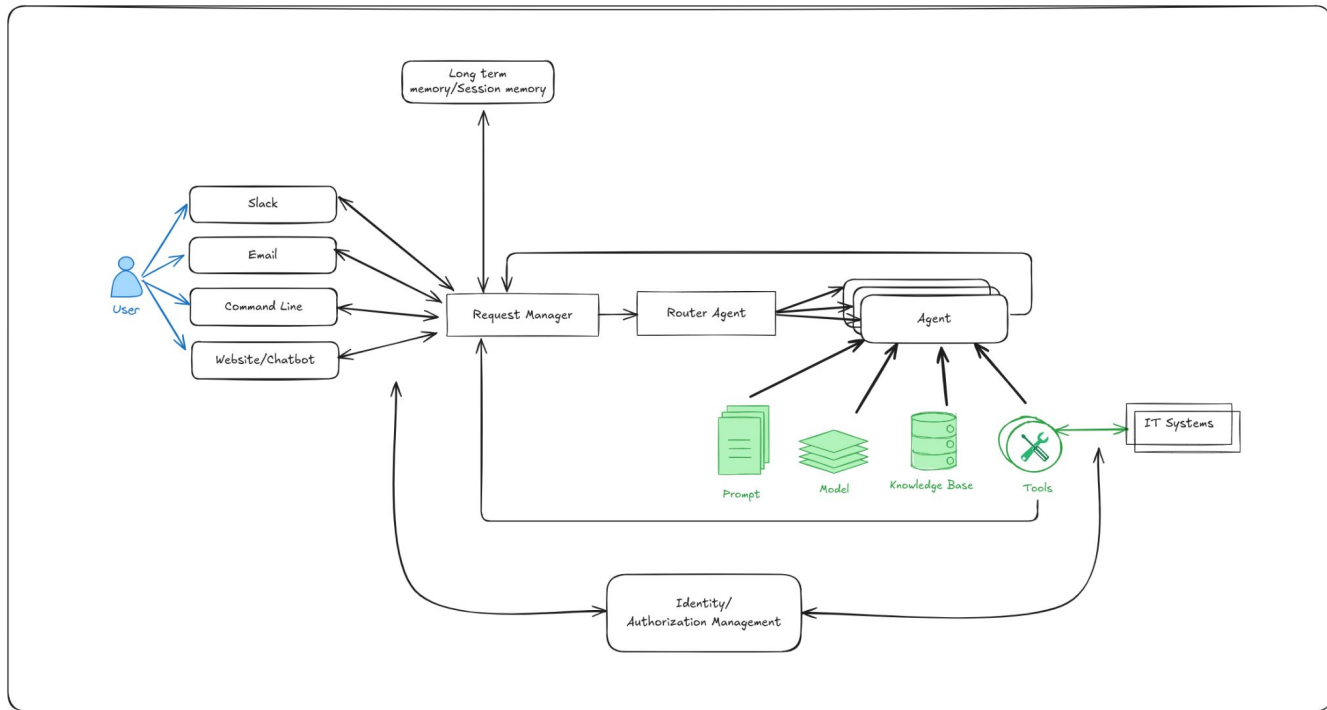

Alas, things move quickly

- Many original APIs being deprecated
- Moving to OpenAI compatible endpoints
 - Completions API
 - Responses API

Key Topics remain the same

- Getting it running
- Clients
- Retrieval Augmented Generation
- Tool Calling and Agents
- Safeguards
- Observability

IT self service agent - laptop refresh quickstart

- Laptop policy RAG database

Getting it running - easiest - podman/Ollama

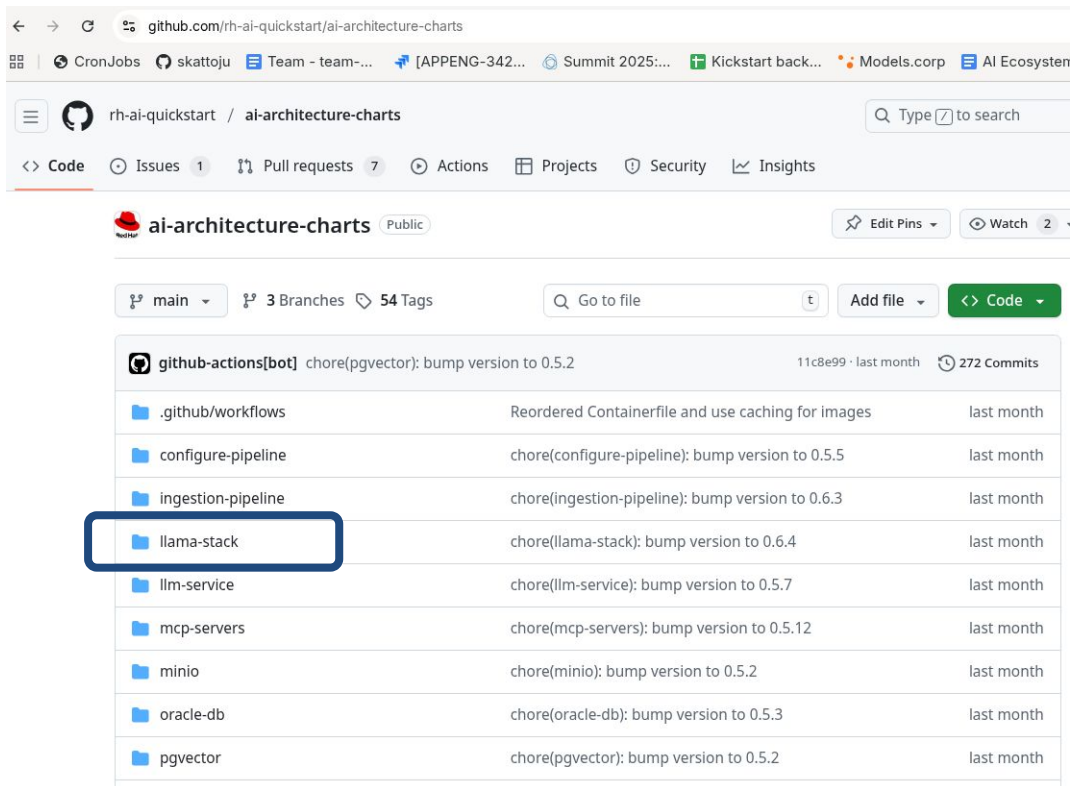

```
export
DATA_DIR=/home/midawson/presentations/confoo/start-llama-stack/.llama/data
export LLAMA_STACK_PORT=8321
export OLLAMA_HOST=10.1.2.46
```

```
mkdir -p ${DATA_DIR}
podman unshare chown -R 1001:1001 ${DATA_DIR}
chmod -R 755 ${DATA_DIR}
```

```
podman run -it \
  -p ${LLAMA_STACK_PORT}:${LLAMA_STACK_PORT} \
  -v ${DATA_DIR}:/llama:Z \
  -e OLLAMA_URL=http://${OLLAMA_HOST}:11434 \
  -e SQLITE_STORE_DIR=/llama \
  -e LLAMA_STACK_PORT=${LLAMA_STACK_PORT} \
  llamastack/distribution-starter:0.3.3
```

```

Corporate Laptop Offering List

****Asia-Pacific (APAC)****

Manufacturer: Apple

Model: MacBook Air M2

ServiceNow Code: apple_mac_book_air_m_2

Target User: General Office

Cost: ¥11,000 CNY

Operating System: macOS

Display Size: 13.6 inches

Display Resolution: 2560 x 1664

Graphics Card: Apple M2 GPU

Minimum Storage: 256 GB SSD

Weight: 2.7 lbs

Ports: 2 x Thunderbolt/USB 4, MagSafe

Minimum Processor: Apple M2

Minimum Memory: 8 GB

Dimensions: 11.97 x 8.46 x 0.44 inches

...

Retrieval Augmented Generation (RAG)

```
# Create vector store with unique name using LlamaStack's OpenAI-compatible API
vector_store_name = f"{kb_name}-kb-{uuid.uuid4().hex[:8]}"
vector_store = self._llama_client.vector_stores.create(
    name=vector_store_name
)
vector_store_id = vector_store.id

# Upload file using LlamaStack's OpenAI-compatible API
with open(file_path, "rb") as f:
    file_create_response = self._llama_client.files.create(
        file=f, purpose="assistants"
    )

file_id = file_create_response.id

# Attach file to vector store using LlamaStack's OpenAI-compatible API
self._llama_client.vector_stores.files.create(
    vector_store_id=vector_store_id, file_id=file_id
)
```

Key parameters:

- chunking_strategy.type: "auto" or "static"
- max_chunk_size_tokens: Maximum tokens per chunk
- embedding_model: Which model to use
- embedding_dimension: Dimension of embeddings
- provider_id: Which vector store backend to use

https://github.com/rh-ai-quickstart/it-self-service-agent/blob/main/agent-service/src/agent_service/knowledge/kb_manager.py

Retrieval Augmented Generation - scaling

Configure vector_io kvstore to use PostgreSQL for multi-replica support

vectorIOKvstore:

type: **postgres**

db_path: null # Explicitly unset SQLite field

namespace: llamastack_vector_io

host: \${env.POSTGRES_HOST:=pgvector}

port: \${env.POSTGRES_PORT:=5432}

db: \${env.POSTGRES_DBNAME:=rag_blueprint}

user: \${env.POSTGRES_USER:=postgres}

password: \${env.POSTGRES_PASSWORD:=rag_password}

Configure metadata store to use PostgreSQL for multi-replica support

metadataStore:

type: **postgres**

db_path: null # Explicitly unset SQLite field

host: \${env.POSTGRES_HOST:=pgvector}

port: \${env.POSTGRES_PORT:=5432}

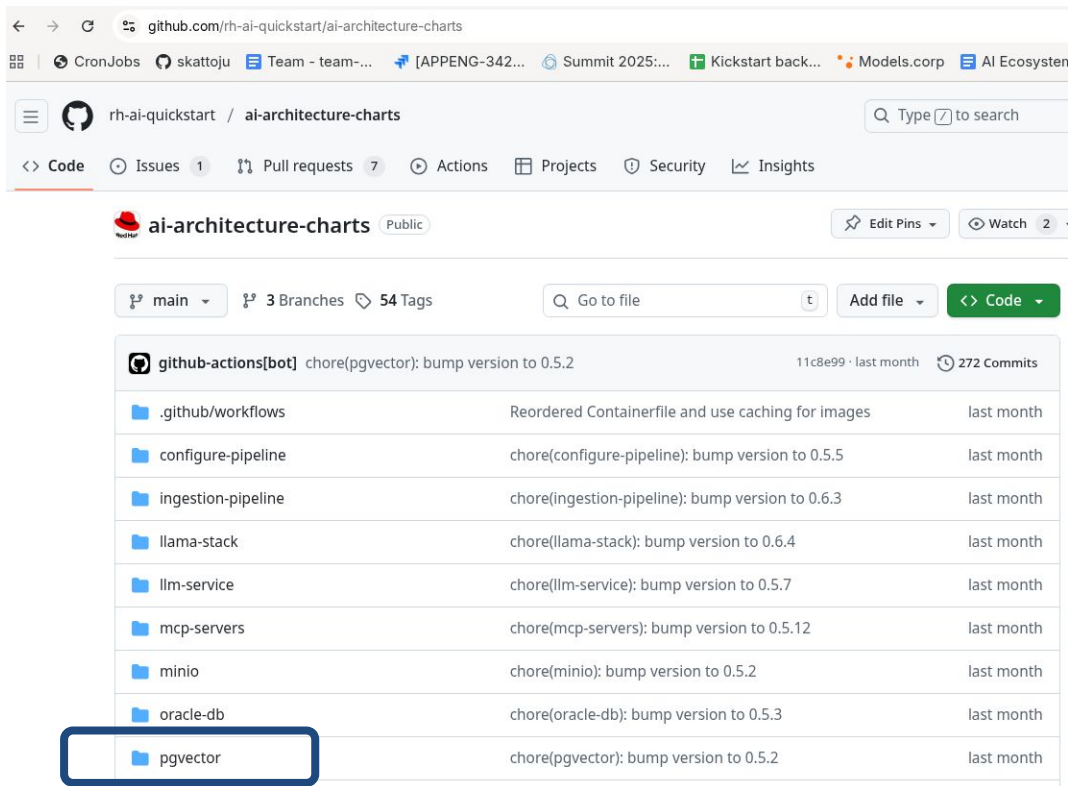

db: \${env.POSTGRES_DBNAME:=rag_blueprint}

user: \${env.POSTGRES_USER:=postgres}

password: \${env.POSTGRES_PASSWORD:=rag_password}

namespace: llamastack_registry

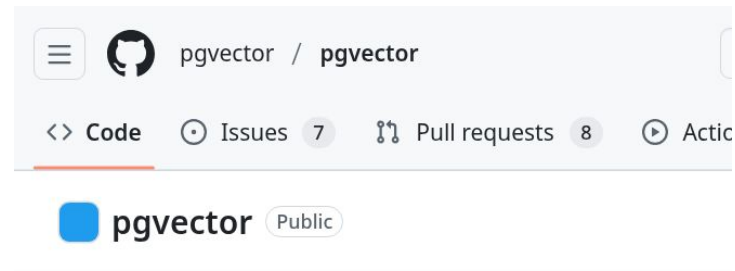

Retrieval Augmented Generation - pgvector

The screenshot shows the GitHub repository 'ai-architecture-charts' by 'rh-ai-quickstart'. The repository is public and has 3 branches and 54 tags. The file list shows several folders, with 'pgvector' highlighted by a blue box. The 'pgvector' folder has a commit message 'chore(pgvector): bump version to 0.5.2' and was committed last month.

File/Folder	Commit Message	Commit Date
github-actions[bot]	chore(pgvector): bump version to 0.5.2	11c8e99 · last month
.github/workflows	Reordered Containerfile and use caching for images	last month
configure-pipeline	chore(configure-pipeline): bump version to 0.5.5	last month
ingestion-pipeline	chore(ingestion-pipeline): bump version to 0.6.3	last month
llama-stack	chore(llama-stack): bump version to 0.6.4	last month

minio	chore(minio): bump version to 0.5.2	last month
oracle-db	chore(oracle-db): bump version to 0.5.3	last month
pgvector	chore(pgvector): bump version to 0.5.2	last month

Open source extension for PostgreSQL that adds support for acting as vector database

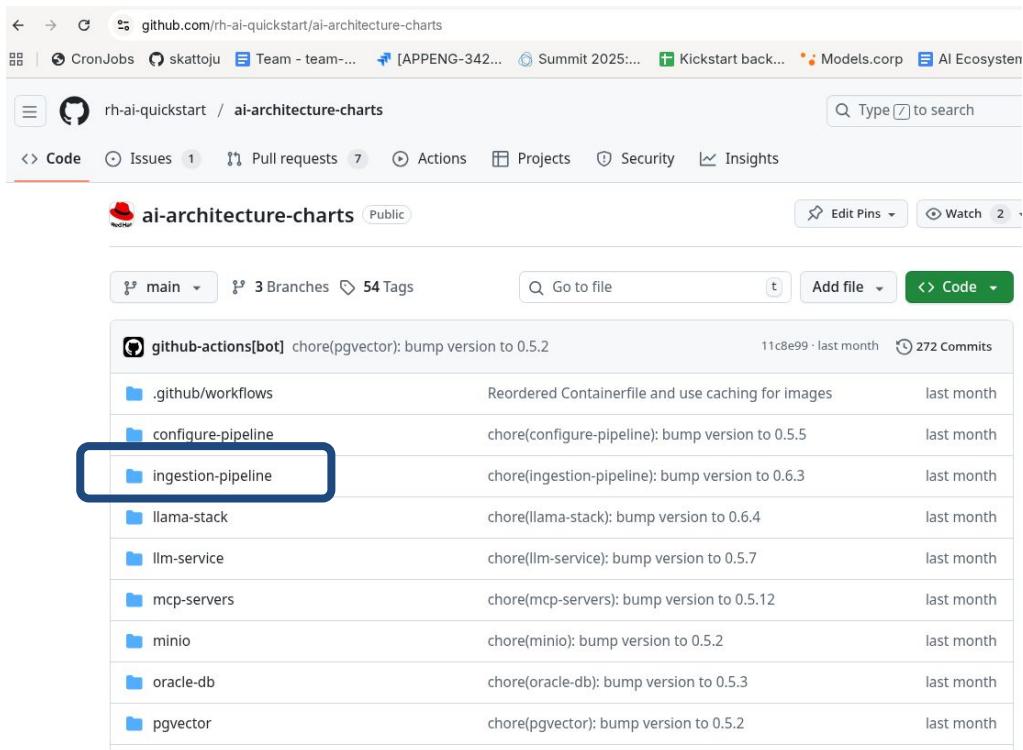

The screenshot shows the GitHub repository 'pgvector' by 'pgvector'. The repository is public and has 7 issues, 8 pull requests, and 1 action. The repository name 'pgvector' is highlighted with a blue box.

<https://github.com/pgvector/pgvector>

Retrieval Augmented Generation - a wrinkle

- Available vector dbs stored in metadata
- Synchronization not immediate
- [llama-stack-post-init-scaler-job.yaml](#)
 - Waits until vector dbs populated
 - Scales up Llama Stack to target instances

Retrieval Augmented Generation - production

The screenshot shows the GitHub repository page for 'ai-architecture-charts' by 'rh-ai-quickstart'. The repository is public and has 3 branches and 54 tags. The 'ingestion-pipeline' folder is highlighted with a blue box. The table below lists the files and folders in the repository, along with their commit messages and dates.

File/Folder	Commit Message	Commit Date
github-actions[bot]	chore(pgvector): bump version to 0.5.2	11c8e99 - last month
.github/workflows	Reordered Containerfile and use caching for images	last month
configure-pipeline	chore(configure-pipeline): bump version to 0.5.5	last month
ingestion-pipeline	chore(ingestion-pipeline): bump version to 0.6.3	last month
llama-stack	chore(llama-stack): bump version to 0.6.4	last month
llm-service	chore(llm-service): bump version to 0.5.7	last month
mcp-servers	chore(mcp-servers): bump version to 0.5.12	last month
minio	chore(minio): bump version to 0.5.2	last month
oracle-db	chore(oracle-db): bump version to 0.5.3	last month
pgvector	chore(pgvector): bump version to 0.5.2	last month

Ingestion Pipeline Helm Chart

This Helm chart deploys a comprehensive RAG (Retrieval-Augmented Generation) data ingestion pipeline that processes documents from various sources and stores vector embeddings for semantic search.

Retrieval Augmented Generation - querying

Responses API

```
response = self.llama_client.responses.create(  
    input=messages_with_system,  
    model=self.model,  
    **response_config,  
    tools=tools_to_use,  
)
```

```
[  
    {  
        "type": "file_search",  
        "vector_store_ids": ["1234"]  
    }  
]
```

https://github.com/rh-ai-quickstart/it-self-service-agent/blob/main/agent-service/src/agent_service/langgraph/responses_agent.py

Direct

```
search_results =  
client.vector_stores.search(  
    vector_store_id=vector_store.id,  
    query="How do you do great work?",  
    max_num_results=3  
)
```

Tool Calling and Agents - Who calls tools?

- Completions API
 - Your program
- Responses API
 - Llama Stack

Tool Calling and Agents - you doing the work

```
const availableTools = [
  {
    type: 'function',
    function: {
      name: 'favorite_color_tool',
      description:
        'returns the favorite color for person given their City and Country',
      parameters: {
        type: 'object',
        properties: {
          city: {
            type: 'string',
            description: 'the city for the person',
          },
          country: {
            type: 'string',
            description: 'the country for the person',
          },
        },
        required: ['city', 'country'],
      },
    },
  },
];

const response = await client.chat.completions.create({
  messages: messages,
  model: model_id,
  tools: availableTools,
});

console.log('  RESPONSE:' +
  (await handleResponse(messages, response)));
```

Tool Calling and Agents - you doing the work

```
const funcs = {
  favorite_color_tool: getFavoriteColor,
};

function getFavoriteColor(args) {
  const city = args.city;
  const country = args.country;
  if (city === 'Ottawa' && country === 'Canada') {
    return 'the favoriteColorTool returned that the favorite color for Ottawa Canada is black';
  } else if (city === 'Montreal' && country === 'Canada') {
    return 'the favoriteColorTool returned that the favorite color for Montreal Canada is red';
  } else {
    return `the favoriteColorTool returned The city or country
      was not valid, assistant please ask the user for them`;
  }
}
```

Tool Calling and Agents - you doing the work

```
async function handleResponse(messages, response) {
  // push the models response to the chat
  const message = response.choices[0].message;
  messages.push({
    role: 'assistant',
    content: message.content,
    tool_calls: message.tool_calls || null,
  });
  if (message.tool_calls && message.tool_calls.length !== 0) {
    for (const toolCall of message.tool_calls) {
      const func = funcs[toolCall.function.name];

      const args =
        typeof toolCall.function.arguments === 'string'
          ? JSON.parse(toolCall.function.arguments)
          : toolCall.function.arguments;
      const funcResponse = func(args);
      messages.push({
        role: 'tool',
        content: funcResponse,
        tool_call_id: toolCall.id,
      });
    }
  }
}
```

```
return handleResponse(
  messages,
  await client.chat.completions.create({
    messages: messages,
    model: model_id,
    tools: availableTools,
  }),
);
} else {
  // no function calls just return the response
  return message.content;
}
}
```

Tool Calling and Agents - Responses API

NOTE: Llama Stack agents migration to Responses API

Llama stack agents

- MCP server registered with Llama stack

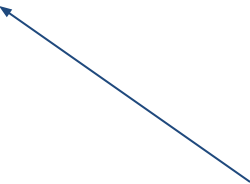

- toolgroups (ex `"mcp::mcp_favorites"`) passed to agent creation

Response API

- Responses.create API call passed URL for MCP server

Tool Calling and Agents - Responses API

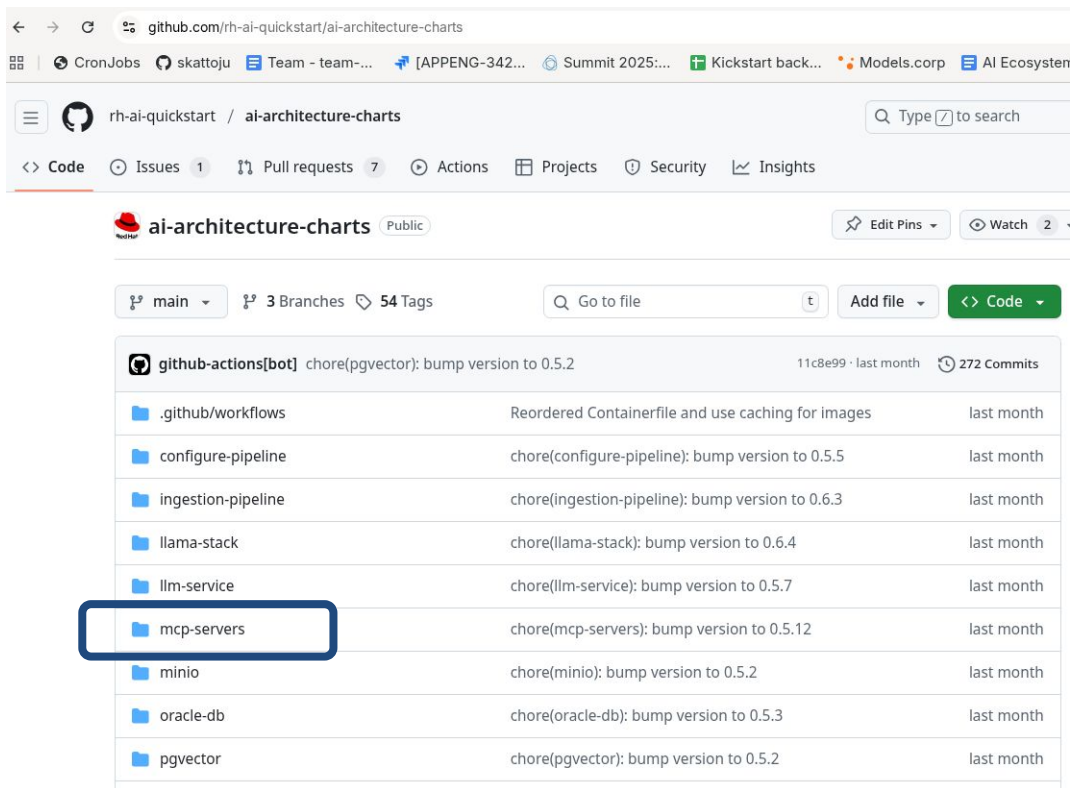

```
response = self.llama_client.responses.create(  
    input=messages_with_system,  
    model=self.model,  
    **response_config,  
    tools=tools_to_use,  
)  
[

105
106         Args:
107             employee_name: The full name of the employee
108             business_justification: Business reason for the laptop refresh request
109             servicenow_laptop_code: ServiceNow laptop choice code from the catalog item.
110                                 Examples: 'apple_mac_book_air_m_3', 'lenovo_think_pad_p_16_gen_2',
111                                 'lenovo_think_pad_t_14_s_gen_5_amd'
112                                 IMPORTANT: This must be the exact ServiceNow Code from the knowledge base,
113                                 NOT the human-readable model name.
114
115         Returns:
116             A formatted string containing the ticket details
117         """
118         try:
119             if not employee_name:
```

Tool Calling and Agents - Responses API

The screenshot shows the GitHub repository page for 'ai-architecture-charts'. The repository is public and has 3 branches and 54 tags. The 'mcp-servers' directory is highlighted with a blue box. The repository is managed by 'github-actions[bot]' and has 272 commits.

Directory	Description	Last Commit
.github/workflows	Reordered Containerfile and use caching for images	last month
configure-pipeline	chore(configure-pipeline): bump version to 0.5.5	last month
ingestion-pipeline	chore(ingestion-pipeline): bump version to 0.6.3	last month
llama-stack	chore(llama-stack): bump version to 0.6.4	last month
llm-service	chore(llm-service): bump version to 0.5.7	last month
mcp-servers	chore(mcp-servers): bump version to 0.5.12	last month
minio	chore(minio): bump version to 0.5.2	last month
oracle-db	chore(oracle-db): bump version to 0.5.3	last month
pgvector	chore(pgvector): bump version to 0.5.2	last month

Tip for scalability: don't use sse, instead:

```
stateless_http=(MCP_TRANSPORT ==  
"streamable-http"),
```

Tool Calling and Agents - Responses API

You are a helpful laptop refresh assistant.

CRITICAL: DO NOT announce what you are about to do (e.g., "I will look up your information", "Let me check the database"). Execute tool calls silently and present only the results to the user.

CRITICAL: Look up the laptop information for the authenticated user by using the `get_employee_laptop_info` tool.

CRITICAL: You MUST include ALL laptop information EXACTLY as returned by `get_employee_laptop_info`. Do NOT summarize, do NOT omit any fields, do NOT reformat. Copy the COMPLETE output including all fields: Employee Name, Employee Location, Laptop Model, Laptop Serial Number, Laptop Purchase Date, Laptop Age, Laptop Warranty Expiry Date, Laptop Warranty.

CRITICAL: If any values are missing in the tool output, keep them empty - do NOT invent values.

If the user is not found, explain that their information was not found in the database.

Tool Calling and Agents - Responses API

Agent: Your laptop, **an EliteBook 840 G7, was purchased on 2019-05-12 and is currently 6 years and 5 months old.** The company's laptop refresh policy states that standard laptops will be refreshed every 3 years from the date of issuance. Since your laptop is older than 3 years, you are eligible for a laptop refresh. Would you like to proceed with reviewing the available laptop options for your location?

Observability

Observability - OpenTelemetry

A screenshot of a web browser displaying the OpenTelemetry GitHub repository page. The browser's address bar shows the URL `github.com/open-telemetry`. The page header includes a hamburger menu icon, the GitHub logo, and a "Sign in" button. The repository name "open-telemetry" is prominently displayed. Below the header, the repository's profile picture is shown, followed by the title "OpenTelemetry - CNCF". A description states: "OpenTelemetry makes robust, portable telemetry a built-in feature of cloud-native software." A green "Verified" badge is located beneath the description.

Observability - Llama Stack

- support built in to Llama Stack
- just need to configure telemetry provider

telemetry:

- provider_id: meta-reference

provider_type: inline::meta-reference

config:

sqlite_db_path: \${env.SQLITE_DB_PATH:=~/llama/distributions/starter/trace_store.db}

{{- if .Values.otelExporter }}

sinks: \${env.TELEMETRY_SINKS:=console,sqlite,**otel_trace**}

service_name: {{ include "llama-stack.fullname" . }}

otel_exporter_otlp_endpoint: \${env.OTEL_EXPORTER_OTLP_ENDPOINT:=}

{{- else }}

sinks: \${env.TELEMETRY_SINKS:=console,sqlite}

{{- end }}

Observability - auto instrumentation

- Checks for `OTEL_EXPORTER_OTLP_ENDPOINT` - Only enables if this env var is set
- Sets up TracerProvider with service name
- Configures OTLP HTTP exporter to send traces to the endpoint
- Auto-instruments **HTTPX** - All HTTP client calls are automatically traced
- Auto-instruments **FastAPI** - All incoming HTTP requests are automatically traced
- Sets up trace **context propagation** - Ensures distributed traces are connected across services

Observability - auto instrumentation

```
def run(service_name: str, logger: typing.Any) -> None:
    otel_exporter_endpoint = os.environ.get(OTEL_EXPORTER_OTLP_ENDPOINT)
    if not otel_exporter_endpoint:
        logger.info("OTEL exporter endpoint not provided -- skip auto tracing config.")
        return

    # Set up the tracer provider with service name
    resource = Resource(attributes={service_attributes.SERVICE_NAME: service_name})
    trace.set_tracer_provider(TracerProvider(resource=resource))

    # Set up the OTLP exporter
    otlp_exporter = OTLPSpanExporter(
        endpoint=f"{otel_exporter_endpoint}/v1/traces",
    )

    # Set up the span processor
    span_processor = BatchSpanProcessor(otlp_exporter)
    trace.get_tracer_provider().add_span_processor(span_processor)

    # Set up instrumentations
    HTTPXClientInstrumentor().instrument() # Auto-instrument HTTPX client

    # Set up propagator
    set_global_textmap(TraceContextTextMapPropagator())
```

[tracing-config/src/tracing_config/auto_tracing.py](https://github.com/open-telemetry/opentelemetry-python/blob/main/tracing-config/src/tracing_config/auto_tracing.py)

Observability - auto instrumentation

1. Import and Initialize (at module level):

```
from opentelemetry.instrumentation.fastapi import FastAPIInstrumentor
from tracing_config.auto_tracing import run as auto_tracing_run
from tracing_config.auto_tracing import tracingIsActive
```

```
SERVICE_NAME = "request-manager" # or integration-dispatcher, etc.
logger = configure_logging(SERVICE_NAME)
auto_tracing_run(SERVICE_NAME, logger) # Initialize OTEL
```

2. Instrument FastAPI App (at module end):

```
if tracingIsActive():
    FastAPIInstrumentor.instrument_app(app)
```

Observability - manual instrumentation

```
from opentelemetry.propagate import inject
# Inject current tracing context into headers
inject(tool_headers)
```

```
